ABSTRACT

Members of this panel, with audience participation, will examine the persistence of traditional teaching methods in higher education and question their efficacy in an evolving educational landscape. We will explore whether a universal teaching approach is appropriate across varied disciplines and institutions, from community colleges to four-year universities. The panel will also consider the diverse needs of fields like humanities, sciences, and professional studies, questioning the adequacy of a one-size-fits-all method. Additionally, we will discuss the impending impact of Artificial Intelligence (AI) on teaching methodologies, suggesting that AI's integration will necessitate significant pedagogical shifts in higher education.
